## **CERTIFICATION TEST REPORT**

---

**Manufacturer:** Cal-Comp Indiana  
1 Technology Way  
Logansport, Indiana 46947  
United States of America

**Applicant:** The L.D. Kichler Co.  
7711 East Pleasant Valley Road  
Cleveland, Ohio 44131

**Product:** Design Pro LED Controller

**Models:** 15DC100, 15DC200, 15DC300\*

*\*Denotes actual model tested as worst case of product family.*

**FCC ID:** YNE-CP300334

**Testing Commenced:** Mar. 20, 2014

**Testing Ended:** July 8, 2014

**Summary of Test Results:** Page 5

### **Standards:**

- ❖ **FCC Part 15 Subpart C, Section 15.249**
- ❖ **FCC Part 15 Subpart C, Section 15.215(c) – Additional provisions to the general radiated emission limitations**
- ❖ **FCC15.207 - Conducted Limits**
- ❖ **FCC Part 15 Subpart A, Section 15.31(e) – Measurement Standards**

Order Number: F2LQ5984

Client: The L.D. Kichler Company

Model: 15DC300

Evaluation Conducted by:

Michael Toth, Senior EMC Eng.

Ken Littell, EMC Tech. Mgr.

Report Reviewed by:

## 1 ADMINISTRATIVE INFORMATION

### 1.1 Measurement Location:

F2 Labs in Middlefield, Ohio. Site description and attenuation data are on file with the FCC's Sampling and Measurement Branch at the FCC Laboratory in Columbia, MD.

### 1.2 Measurement Procedure:

All measurements were performed according to the 2009 version of ANSI C63.4 and recommended FCC procedure of measurement of DTS operating under Section 15.249. A list of the measurement equipment can be found in Section 6.

### 1.3 Uncertainty Budget:

Radiated Emission

- Combined Uncertainty (+ or -) 2.67 dB
- Expanded Uncertainty (+ or -) 5.35 dB

Conducted Emissions

- Combined Uncertainty (+ or -) 1.88 dB
- Expanded Uncertainty (+ or -) 3.75 dB

This uncertainty represents an expanded uncertainty expressed at approximately the 95% confidence level using a coverage factor of  $k=2$ .

### 1.4 Document History:

Document Number	Description	Issue Date	Approved By
F2LQ5984A-01E	First Issue	July 21, 2014	W. Fuster

**2 SUMMARY OF TEST RESULTS**

Test Name	Standard(s)	Results
-20dB Occupied Bandwidth	CFR 47 Part 15.215(c)	Complies
Field Strength of Emissions	CFR 47 Part 15.249(a)(d)	Complies
Conducted Emissions	CFR 47 Part 15.207(a)	Complies
Voltage Variation	CFR 47 Part 15.31(3)(e)	Complies

Note: Voltage Variation testing in 15.31(3)(e) was performed at the nominal voltage, and then the 85% and 115% of that voltage was tested also. The output power at the frequency was measured to verify how much the power and frequency was affected by the variation of the input power. No shift in frequency or power was measured at either of the varied voltages on any of the channels.

Modifications Made to the Equipment
None

### 3 TABLE OF MEASURED RESULTS

Test	Unloaded 908.4MHz	Loaded 908.4MHz
Field Strength of Fundamental	80.5dB $\mu$ V/m	75.5dB $\mu$ V/m
Limit for Fundamental	50 millivolts/meter (93.98 dB $\mu$ V/m)	50 millivolts/meter (93.98 dB $\mu$ V/m)
-20dB Occupied Bandwidth	58.2979kHz	59.6145kHz

The 20 dB bandwidth of the emission shall be contained within the frequency band designated in the rule section under which the equipment is operated.

#### **4 ENGINEERING STATEMENT**

This report has been prepared on behalf of The L.D. Kichler Company to provide documentation for the testing described herein. This equipment has been tested and found to comply with part 15.249 of the FCC Rules using ANSI C63.4 2009 standard. The test results found in this test report relate only to the items tested.

## **5 EUT INFORMATION AND DATA**

### **5.1 Equipment Under Test:**

Product: Design Pro LED Controller

Model: 15DC300

Serial No.: None Spec.

FCC ID: YNE-CP300334

### **5.2 Trade Name:**

The L.D. Kichler Co.

### **5.3 Power Supply:**

120 Volts AC

### **5.4 Applicable Rules:**

CFR 47, Part 15.249

### **5.5 Equipment Category:**

Radio Transmitter-DTS

### **5.6 Antenna:**

0dBi Gain Integral Antenna

### **5.7 Accessories:**

N/A

### **5.8 Test Item Condition:**

The equipment to be tested was received in good condition.

### **5.9 Testing Algorithm:**

The EUT was set up in a normal operating mode supplying voltage to landscaping lights. The EUT was also outfitted with a Z-Wave wireless module which enables the user to send and received basic ON/OFF commands, synchronize date/time/location, and other useful information with other devices containing a Z-Wave wireless module.

## **7 FCC PART 15.215(e) – OCCUPIED BANDWIDTH**

### **7.1 Requirements:**

Intentional radiators operating under the alternative provisions to the general emission limits, as contained in §§15.217 through 15.257 and in Subpart E of this part, must be designed to ensure that the 20 dB bandwidth of the emission, or whatever bandwidth may otherwise be specified in the specific rule section under which the equipment operates, is contained within the frequency band designated in the rule section under which the equipment is operated. The requirement to contain the designated bandwidth of the emission within the specified frequency band includes the effects from frequency sweeping, frequency hopping and other modulation techniques that may be employed as well as the frequency stability of the transmitter over expected variations in temperature and supply voltage.

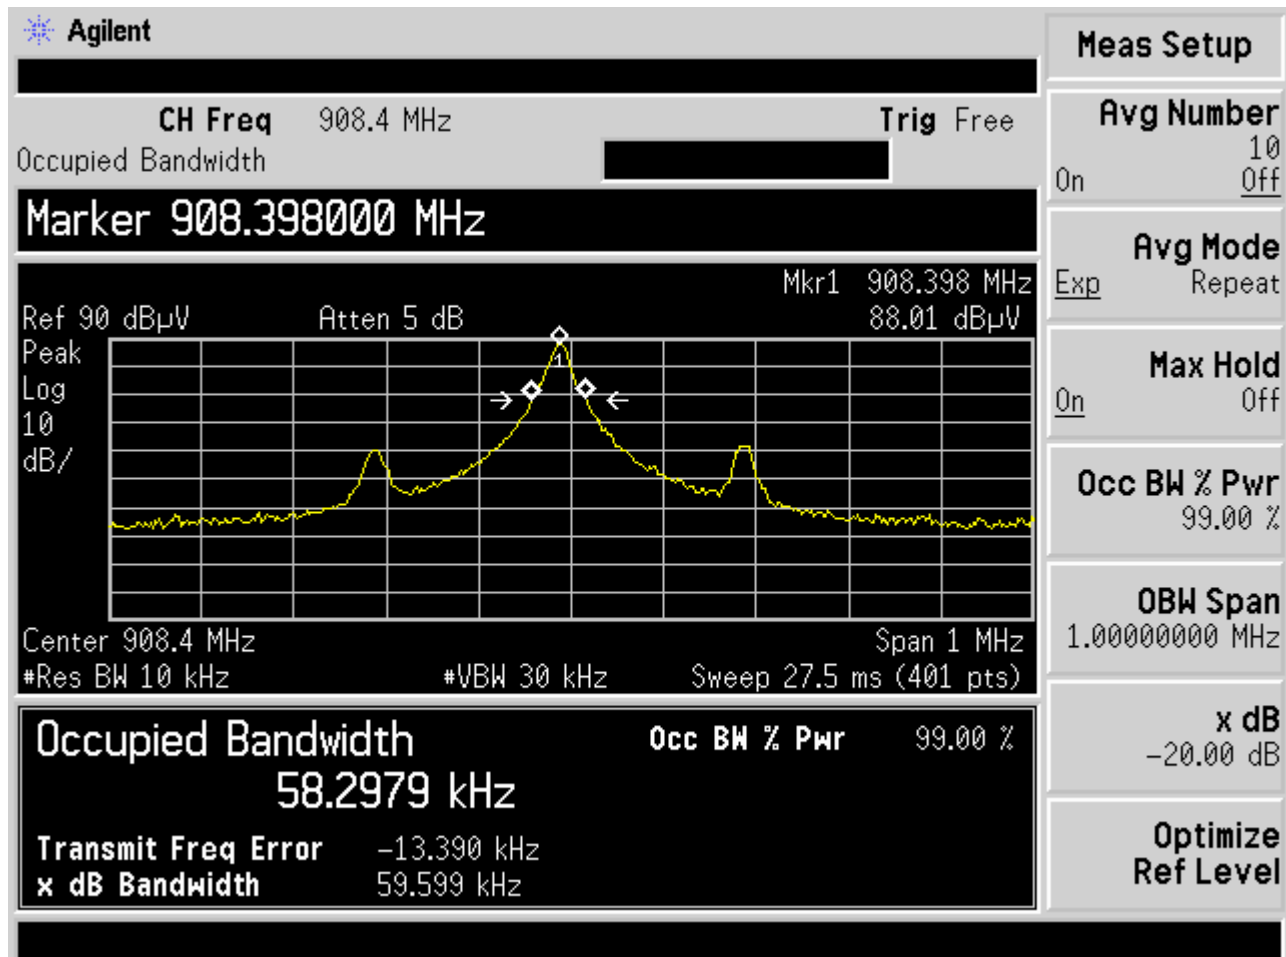

Bandwidth measurements were made using the analyzer's marker function.

## 7.2 Occupied Bandwidth Test Data

Test Date:	July 8, 2014	Test Engineer(s):	M. Toth
Standards:	CFR 47 Part 15.215(c)	Air Temperature:	21.6°C
		Relative Humidity:	54%

## Unloaded

Loaded

**8 FCC PART 15.249(a)(d) – FIELD STRENGTH OF EMISSIONS FROM INTENTIONAL RADIATORS**

(a) Except as provided in paragraph (b) of this section, the field strength of emissions from intentional radiators operated within these frequency bands shall comply with the following:

<b>Fundamental frequency</b>	<b>Field strength of fundamental (millivolts/meter)</b>	<b>Field strength of harmonics (microvolts/meter)</b>
902-928 MHz	50	500
2400-2483.5 MHz	50	500
5725-5875 MHz	50	500
24.0-24.25 GHz	250	2500

(d) Emissions radiated outside of the specified frequency bands, except for harmonics, shall be attenuated by at least 50 dB below the level of the fundamental or to the general radiated emission limits in §15.209, whichever is the lesser attenuation.

NOTE: During the pre-scan evaluation, the EUT was manually rotated in all possible directions to find the maximum emissions. The orthogonal position that showed the highest emissions was used. The antenna was raised between 1 and 4 meters and the EUT turntable was rotated 360 degrees to maximize the emissions. The following tables list the fundamental frequency measured as well as frequencies near the fundamental.

**8.1 Test Data - Field Strength of Emissions from Intentional Radiators**

## 8.2 Test Data – Spurious Emissions

Notes: Plots are peak, max hold pre-scan data included only to determine what frequencies to investigate and measure. During the pre-scan evaluation, the EUT was rotated in all possible directions to find the maximum emissions. The orthogonal position that showed the highest emissions was used. At some frequencies, no emissions from the EUT were measurable over the ambient noise floor. The readings did not change with EUT on and EUT off.

At least 6 of the highest frequencies were measured per ANSI 63.4 on the Open Area Test Site. Frequencies below 1GHz were measured using a quasi-peak detector. The antenna was raised between 1 and 4 meters and the EUT turntable was rotated 360 degrees to maximize the emissions. Some of the frequencies did not change with the EUT on or off. At those frequencies, the test distance was shortened to 1 meter and still no emissions from the EUT were visible or over the ambient or limit.

In the following plots, the black line indicates ambient noise and the red line indicates the measurement with the EUT on. Emissions to be found by the EUT were measured and listed in tables below.

<b>Test Dates:</b>	May 22, 2014; July 8, 2014	<b>Test Engineer(s):</b>	M. Toth
<b>Standards:</b>	CFR 47 Part 15.249(d) / Part 15.209	<b>Air Temperature:</b>	26.9°C
		<b>Relative Humidity:</b>	55%

## 9 CONDUCTED EMISSIONS

### 9.1 Requirements

In accordance with FCC CFR 47 Part 15.207(a), "Except as shown in paragraphs (b) and (c) of this section, for an intentional radiator that is designed to be connected to the public utility (AC) power line, the radio frequency voltage that is conducted back onto the AC power line on any frequency or frequencies, within the band 150 kHz to 30 MHz, shall not exceed the limits in the following table, as measured using a 50  $\mu$ H/50 ohms line impedance stabilization network (LISN). Compliance with the provisions of this paragraph shall be based on the measurement of the radio frequency voltage between each power line and ground at the power terminal. The lower limit applies at the boundary between the frequency ranges.

Frequency of emission (MHz)	Conducted limit (dB $\mu$ V)	
	Quasi-peak	Average
0.15-0.5	66 to 56*	56 to 46*
0.5-5	56	46
5-30	60	50

\*Decreases with the logarithm of the frequency.

### 9.2 Procedure

The EUT was placed on a 1.0 x 1.5 meter non-conductive table, 0.8 meter above a horizontal ground plane and 0.4 meter from a vertical ground plane. Power was provided to the EUT through a LISN bonded to a 3 x 2 meter ground plane. The LISN and peripherals were supplied power through a filtered AC power source. The output of the LISN was connected to the input of the receiver via a transient limiter, and emissions in the range 150 kHz to 30 MHz were measured. The measurements were recorded using the quasi-peak and average detectors as directed by the standard, and the resolution bandwidth during testing was 9 kHz. The raw measurements were corrected to allow for attenuation from the LISN, transient limiter and cables.
